Budapest gas-works. S. Bando and J. Cipera (Palma, 1961, 81, 258-260) — Besides a small amount of Hungarian coal, mainly Czechoslovak and Polish coals are used after transport on the Danube and direct transfer from ship to breaker. Gas is made in horizontal Koppers retorts, heated by generator gas from Hungarian brown coal and partly freed from tar in an electrostatic purifier. The tar in the cooled combustion gas is removed through the centrifugal force of a turboventilator. Details are given of the removal of naphthalene, ammonia, and  $H_2S$ , and the recovery of benzene. Generator gas is also used as addition to town's gas after purification in an electrostatic tar remover. The tar removal is

almost complete and there have been no breakdowns. Water gas is made from coke in a three generator station. The gas works have their own source of natural gas, which is piped into the works together with naphtha. During peak hours an additional plant producing liquid gas (mixture of propane, butane and gasoline) is in operation.

"Identification of Gram-Negative, Non-Fermenting Bacteria in Clinical Laboratories."

Budapest, Kiserletes Orvostudomany, Vol XVIII, No 2, Apr 66, pages 216-221.

Abstract: [Authors' German summary] The identification of Gram-negative, non-fermenting bacteria present in clinical samples is described. Their identification as well as differentiation from enteric bacteria is done with the following tests: Glucose splitting (oxidative or enzymatic), oxidase reaction, splitting of urea, nitrate reduction, gelatine decomposition, motility. These methods are usually sufficient for differentiation between *Pseudomonas aeruginosa*, *Achromobacter lwoffii*, *Achromobacter anitratus*, *Bordetella bronchiseptica*, *B. parapertussis*, *Alcaligenes faecalis* and *Morazella duplex*. 1 Hungarian, 16 Western references. SUMMARY

BALINT, J., BONTEGLAY, S.; Biophysical Institute and Central Laboratory of the Medical University (Orvostudomanyi Egyetem Biokimikai Intezete es Kozponti Laboratorium), Pecs.

"The Isocellar structure of the Striated fibril."

Acta Physiologica Academiae Scientiarum Hungaricae, Vol. 34, No. 3-4, 1964, pp. 211-220.

ABSTRACT: [English article; authors' English summary abstracted] The authors discuss contradictions between current conceptions of the structure of the striated muscle fibril and experimental observations. Data in the literature and their own observations are interpreted in terms of a new hypothesis. They caution against the formulation of premature theories. Their hypothesis assumes a longitudinal and transverse isocellar structure of the fibril. (Of 14 references 5 are non-western and the rest western.)

AUTHOR: Bendefy, L.

TITLE: Seismotectonic investigations in western districts  
of Zadunaya

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 2, 1962, 18, abstract 2A132 (Földr. ert., 10, no. 2, 1961, 181-210)

TEXT: The largest earthquakes which occurred in the territory of the Vash and Zala regions were studied. Most of the earthquakes took place in the belt where Paleozoic and Mesozoic rocks are in contact. The results of the investigations corroborated the existence of seismic blocks. The hypocenter of the earthquake that occurred in Hungary on January 8, 1908, was determined. It is suggested that during this earthquake oscillations with an intensity of 2 - 3 points alternated with vibrations of 3 - 5 points. The connexion between the structural constitution of the studied areas and the isoseismal form was established. An attempt was made to establish the link between the destruction picture and the struc-

"Alkaline Phosphatase Activity of the Renal Tubules in Experimental Post-Ischemic Renal Failure of Rats"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricarum, Vol 30, No 2, 1968; pp 175-182.

Abstract [Article in English; authors' English summary, modified]: By means of a two-hour ligation of the renal artery of rats, a condition resembling acute human renal failure was brought about. The phosphatase activity in renal tubules decreased prior to the development of oliguria and azotemia and disappeared when renal failure was complete. Pentobarbital anesthesia mitigated or even prevented the post-ischemic condition. In most anesthetized animals the alkaline phosphatase activity returned to normal after a decrease following ligation. Regeneration of tubular cells after the ligation took about four weeks if the contralateral kidney was intact. Changes in alkaline phosphatase activity paralleled those in tubular activity: decrease in the former indicated increasing renal failure, and its return to normal indicated tubular regeneration. 42 References, of which 9 by Hungarian authors (5 in Hungarian journals), rest Western. (Manuscript received 27 Sep 65).

"Electric Shock and Resuscitation."

Budapest, Orvosi Hetilap, Vol 107, No 43, 23 Oct 66, pages 2035-2038.

Abstract: [Author's Hungarian summary] The case of a young man is described who was resuscitated after a lethal shock from high tension electricity and was kept alive for 13 days. The author joins those who stress the importance of an expansion of teaching the use of modern resuscitation techniques at the site of an accident, since the time factor is of decisive importance in the warding off of irreversible damage to the cerebral cortex. 15 Eastern European, 16 Western references.
